Kisan Mitra — Crop Doctor Report

Report ID: KM-000001

Date: 2026-10-31T21:21:21

Crop: Unknown (likely a broadleaf ornamental or vegetable)

Possible condition: Suspected fungal leaf spot or blight

AI assessment (not a calibrated probability): 45.00%

Severity: Moderate to High

Visible symptoms

- Large, irregular brown to black necrotic lesions
- Distinct yellow halos surrounding the dark spots
- Leaf tissue collapse and drying
- Visible leaf distortion and curling

Suggested treatment / care

- Remove and dispose of all affected leaves to prevent spread
- Apply a general-purpose fungicide labeled for leaf spot or blight
- Improve air circulation around the plant
- Consult a local agricultural extension for a specific diagnosis and treatment plan

Prevention

- Avoid overhead watering to keep foliage dry
- Ensure adequate spacing between plants for airflow
- Practice crop rotation if this is an annual crop
- Remove plant debris from the soil surface

Important: This is an AI-generated assessment and not a professional diagnosis. The specific crop is not identifiable from the image. Please consult a local agricultural extension service or a certified plant pathologist for a definitive diagnosis and treatment recommendation.

This is an AI-assisted image assessment, not a laboratory diagnosis. Image-only identification can be wrong. Confirm serious cases with a local agricultural expert. Follow locally approved product labels; no pesticide dosage is prescribed here.
