Kisan Mitra — Crop Doctor Report

Report ID: KM-000002

Date: 2026-10-31T21:34:26

Crop: Unknown broadleaf plant

Possible condition: Suspected fungal leaf spot or blight (e.g., Alternaria or Septoria)

AI assessment (not a calibrated probability): 45.00%

Severity: Moderate to Severe

Visible symptoms

- Large, irregular dark brown to black necrotic lesions
- Distinct yellow halos surrounding the dark spots
- Leaf tissue collapse and browning at the margins
- General leaf distortion and wilting

Suggested treatment / care

- Remove and destroy all visibly infected leaves to reduce inoculum
- Apply a broad-spectrum fungicide labeled for leaf spot or blight, following label instructions
- Improve air circulation around the plant to reduce humidity

Prevention

- Avoid overhead watering to keep foliage dry
- Ensure adequate spacing between plants for airflow
- Apply a balanced fertilizer to maintain plant vigor
- Rotate crops if this is a recurring issue in the same location

Important: This is an AI-generated assessment based on visual symptoms. The specific pathogen cannot be identified without laboratory testing. Consult a local agricultural extension service for a definitive diagnosis and treatment plan.

This is an AI-assisted image assessment, not a laboratory diagnosis. Image-only identification can be wrong. Confirm serious cases with a local agricultural expert. Follow locally approved product labels; no pesticide dosage is prescribed here.
